(54) Title: PREPARATION FOR REHYDRATING MONOGASTRIC ANIMALS, INCLUDING HUMAN BEINGS,
SUFFERING FROM DIARRHOEA AND USE THEREOF

(57) Abstract

A preparation for rehydrating monogastric animals, including human beings, and new-born ruminants suffering from diarrhoea which preparation is intended for being mixed in water comprises an absorbent intumescent agent, electrolytes and lactose-decomposing enzyme(s) and possible roughage, taste correctants and/or dyestuffs. The intumescent agent constitutes 20-70% according to weight, preferably 40-43%, the electrolytes constitute 40-60% according to weight, preferably 53-57%, and the enzyme or enzymes constitute 0.01-5% according to weight, preferably 0.025-0.027%, and the balance is made up of roughage, taste correctants and/or dyestuffs, where one type of roughage is wheat bran. It has proved particularly advantageous that the intumescent agent is vegetable fibres from the family Plantaginaceae and the enzyme is lactase with pH-optimum between 2 and 10, and the electrolytes are a mixture of two or more of the substances magnesium oxide, citric acid, potassium chloride, sodium citrate, sodium chloride, sodium bicarbonate, and glucose. An optimum effect is achieved when the fibres are dried crushed seed coats of *Plantago ovata*.

1 PREPARATION FOR REHYDRATING MONOGASTRIC ANIMALS,
INCLUDING HUMAN BEINGS, SUFFERING FROM DIARRHOEA
AND USE THEREOF

5 The invention relates to a preparation for rehydrating monogastric animals, including human beings, suffering from diarrhoea, especially non-infectious diarrhoea and diarrhoea caused by rota and corona viruses.

10 Even in well-organized agricultural countries with good veterinary coverage, the mortality among new-born animals such as calves and pigs is still very great. For example, in Denmark in 1980 there were
15 destroyed about 180,000 calves, which corresponds to nearly 20% of the calves born every year. The cause of a number of the deaths among calves, and also of a number of corresponding deaths among sucking pigs, is that they become stressed when they are weaned and
20 placed, for example, in common sties or folds. When the animals are removed and thus no longer receive mother's milk, right up to half of the animals develop diarrhoea because they become stressed due to change of fodder, transportation etc. It is assumed
25 that half of the deaths are due to diarrhoea which arises within the first month after their birth. A number of the calves also suffer from rota and corona virus infection, which is a contagious intestinal infection where cows are virus carriers and infect
30 the calves. The disease is caused by ia. strongly reduced production of lactase, so that the animals cannot decompose the lactose in the milk with which they are fed, and hereafter diarrhoea is quickly developed by osmotic effect in the intestinal canal.

- 1 New-born calves and pigs with diarrhoea will lose considerably in weight because of dehydration and many die.
- 5 The object of the invention is to present a preparation for the treatment of diarrhoea, so that a very large number of the sick animals can be cured in very few days, whereby deaths due to loss of fluid is avoided and for the calves a higher growth is obtain-
10 ed.

This is achieved by composing the preparation as disclosed in the characterising part of claim 1. Surprisingly, it has been shown that a mixture of an
15 absorbent intumescent agent, lactose-decomposing enzymes and one or more electrolytes is a quick and effective agent against diarrhoea without any apparent side effects and with a better effect than with the individual components alone. The agent can be used
20 for the treatment of diarrhoea among all offspring of ruminants as long as these are one-stomached, ie. before they have begun cud-chewing, and for the treatment of non-infectious diarrhoea and diarrhoea caused by rota and corona viruses among all other one-stom-
25 ached animals, including human beings. The lactose-decomposing enzyme decomposes that lactose which, for example, a calf suffering from diarrhoea is itself unable to decompose and digest. Non-decomposed lactose in the intestinal canal contributes to worsening an
30 attack of diarrhoea. With certain other methods of treatment, it has been suggested that the lactose be decomposed in the milk before the calf receives the milk, but with the preparation according to the invention, the lactose is not decomposed until inside

- 1 the calf's stomach and intestine which results in fewer side effects, for example in the form of sitiophobia.
- 5 The agent is produced quite simply by weighing out and mixing the individual parts so that the finished agent is supplied as a dry powder ready for use.

Another great advantage of the preparation according to the invention is that it is possible to cure animals of diarrhoea without the use of normal antibiotics, and thus avoiding the disadvantages here-with in the form of medicinal residues in the animal, and the possibilities of developing bacteria strains resistant to antibiotics.

According to the invention it is very advantageous that the electrolytes in the preparation comprise such salts that replace salt lost by diarrhoea since by rehydration it is merely necessary to administer a preparation which will bring about both rehydration or stop dehydration and provide the lost salts and fluid.

- 25 When as disclosed in claim 3 the preparation comprises a buffer, it is not necessary to protect the enzymes by adopting special measures since the preparation itself for a period of up to 6 hours stabilises the pH-value of the stomach so that the enzymes are not inactivated, and it is not necessary to wait for the dissolution of a coating or the like in the intestine, the enzyme being immediately ready to perform its function. Thus protective measures for the enzyme are also spared.

1 The component parts must be such which are pharmaceutically tolerable and a combination of the parts mentioned in claim 4 makes it possible to fulfill the purpose of the present invention.

5

By composing the preparation as disclosed in claim 5 there is obtained a simple preparation which has the required properties, ie. stopping diarrhoea, providing the necessary salts, providing lactase and bringing it uninfluenced through the stomach in a simple manner.

15 It is especially advantageous to compose the agent as disclosed in claim 6, the reason being that it has been shown that the absorbent vegetable fibres swell up in the intestine in a very suitable and natural manner, which gives the contents of the intestine a gelatinous consistency so that the faeces will have a normal consistency already a few hours after the 20 first feeding with the agent. The more quickly that a diarrhoea from which a calf or sucking pig is suffering is brought under control, the greater are the chances of the animal surviving. The glucose content and the necessary salts in the correct amounts will 25 promote the absorption of nutrients and give the weakened animal an easily transformable energy.

30 Practical applications and experiments have shown that the agent according to the invention is particularly effective when the fibres are seed coats as disclosed in claim 7.

The relation between the individual components in the preparation according to the invention can vary

1 greatly, but it has been shown that the optimum
effect and protection of the enzymes is achieved if
the individual components are used in the ratios as
disclosed in more detail in claim 8. If this agent
5 is used immediately when an animal shows the symptoms
of diarrhoea, and it is a question of so-called
problem stock, then the agent according to the inven-
tion should be used in the event of the animal mere-
ly refusing to drink up, and a case of diarrhoea can
10 normally be stopped merely by treating the animal
a few times. It is thus possible to put an immediate
stop to the life-threatening loss of water and salts
(electrolytes) so that by far the majority of the
animals attacked will survive and be restored to
15 health quicker than if they are only treated with
electrolytes alone or the water palliative fibres
alone. This quicker restoration of the animals will
therefore bring about a better growth which has been
proved by clinical experiments.

20 By composing the preparation as disclosed in claim 9,
there is obtained a preparation which will stop
diarrhoea among animals and provide rehydration since
the preparation will only have to be mixed in water
25 or milk or a water/milk mixture whereupon an animal
will willingly drink it.

For human application the preparation is composed
without roughage and dyestuffs but with a corrigent
30 having the composition mentioned in claim 10, a
composition as disclosed in claim 11 being particu-
larly preferred since such a preparation is effective and
at the same time has a pleasant taste.

1 Since vegetable fibres as disclosed in claims 3 and
4 are expensive to use, it is possible to replace
the organic absorbent intumescient with a synthetic
intumescient in the carboxymethyl cellulose in dif-
5 ferent configurations with various radicals and
various metals can be used. Innumerable different
carboxymethyl celluloses are known and all of these
can be used, but with different effect, the reason
being that they are available with both different
10 viscosity and different rates of intumescence. The
use of a synthetic intumescient results in a cheaper
product, and generally with sufficient applicability.

15 The preparation according to the invention as dis-
closed in claim 12 is used by pouring 40-55 g of the
mixture into lukewarm water, milk or a water/milk
mixture at around 38°C. The result is a mixture which
the animals are very willing to drink and which
quickly cures them of diarrhoea because the gel form-
20 ed by the agent in the intestinal canal has the fol-
lowing characteristics:

- a) a protective effect on the actual intest-
inal mucosa,
- 25 b) binds some of the bacteria and their
toxins to itself,
- c) ensures a normal intestinal passage
30 (peristalsis),
- d) quickly stops the loss of fluid and
electrolytes,

- 1 e) buffers the capacity due to the added electrolytes in the gel formed, protects the added lactase from inactivation for up to 6 hours, and
- 5 f) the lactase decomposes the lactose in the intestine and thus recreates a normal osmotic balance.
- 10 For human application the same results as mentioned above will be obtained. If desired, cold liquid can be used for the preparation.

Practical experiment with the preparation according
15 to the invention.

480 sucking calves, all of them two to three weeks old, were taken in for rearing experiments under uniform optimum conditions with regard to hygiene, 20 climate and feeding, the object being to test the effect of the preparation on dietetic-conditioned diarrhoea among sucking calves.

• By the first feeding after the calves taken in had 25 been placed in the cow-house at the research station, all of the calves each received three litres of a conventional electrolyte/water mixture, after which this was gradually changed during the course of five days to up to 7 litres of milk substitute. The calves 30 also had free access to hay and ordinary fodder supplements.

During the course of fourteen days from the time they were taken in, 86 of the calves, ie. 17.9%, contract-

1 ed stomach/intestinal disturbances. These animals were immediately treated with the preparation according to the invention and as disclosed in claim 12.

5 73 of the sick calves, ie. 84.9%, were completely cured within a few days. The 13 calves which were not cured immediately by the treatment were then given supplementary treatment with antibiotics.

10 From this it will be seen that the diarrhoea which is contracted early by many calves fattened on full milk and by sucking pigs is often due to virus infections and to transport stress, stress as a result of feeding change and stress from changed environment etc., and can therefore be cured with the preparation according to the invention without the use of antibiotics. Only 13 animals out of 86, ie. approx. 15%, required supplementary antibiotic treatment.

15

20

Course of treatment when using the preparation.

The agent is mixed in water and is dosed in accordance with the weight of the animal, the amounts used 25 being as stated in the following table:

	<u>Weight of animal</u>	<u>Dose per feeding</u>	<u>No. of feeds per 24 hours</u>
	approx. 20 kg	½ l water + approx. 25g	4
30	- 30 kg	1 l - + approx. 50g	4
	- 40 kg	1½ l - + approx. 75g	3-4
	- 50 kg	2 l - + approx. 100g	3
	- 60 kg	2½ l - + approx. 125g	3

1 After the first twenty-four hours, it can be an ad-
vantage to add 25-50 g curdled milk product, for
example soured milk, yoghurt, junket or the like,
per litre. From the third day, one can gradually
5 change over to the normal mixed fodder.

There are also cattle stock among which stomach/
intestine disturbances are a recurrent problem. In
such cases it can be an advantage to give for example
10 the calves the preparation according to the invention
as soon as they just refuse to drink up the normal
feed, for example consisting of full-cream milk or
other milk mixtures or the like.

15 Comparative experiment

The curative properties against diarrhoea of the
preparation according to the invention were compared
by a controlled experiment with the properties of
20 Calmix neo ~~at~~ a Dutch calf fattening station.

For the experiments there were used in all 230 calves
which were divided in 5 groups of 46 animals each.
They were placed in wooden pens with floor grating
25 and being ventilated. One week old calves were used.
The animals were weighed before the experiment, after
29 days and after 58 days. At the beginning there
is given 1.5 l water and 75 g electrolytes as first
feeding. The fodder consisted of a bag of Heftica per
30 calf followed by Hemeka start and fattening accord-
ing to the usual schedule.

In case of diarrhoea either the preparation accord-
ing to the invention or Calmix neo is given.

1 The experiment results are given in the table below.

	Average results Curative treatment	Conservative treatment (Calmix neo)	Preparation according to the invention
5			
	No. of calves	15	15
	Average weight at start	41.6 kg	38.3 kg
10	after 29 days	47.5 kg	45.3 kg
	58 days	74.4 kg	73.7 kg
	Average weight after 29 days	5.9 kg	7.0 kg
15	58 days	32.8 kg	35.4 kg
	Average weight after 29 days	5.9 kg	7.0 kg
	29-58 days	26.9 kg	28.4 kg
20	Average Weight/day		
	after 29 days	203 g	241 g
	59 days	565 g	610 g

25 The curative properties of the preparation prove to be good. After 58 days the calves showed an average of 2.6 kg larger growth than the control group which was treated with Calmix neo. Moreover, the average weight per day among the animals which were treated
30 with the preparation according to the invention, increased in the second period more than the animals treated with Calmix neo. This shows that not only are the absorption and the digestive capacity of the intestine less influenced but they are at the same

1 time more quickly recreated. This result supports the
fact that the pharmacokinetics of the preparation
according to the invention builds on a protection
of the intestinal wall against pathogenic attacks
5 coupled with a compensation for lack of lactase by
means of acid resistant lactase whereby the secre-
tion as well as the osmotic component are combatted.

Example 1

10

The preparation according to the invention can be
composed, for example, as follows:

1000 g contains:

15 Magnesium oxide 5.75 g
Citric acid 13.50 g
Potassium chloride 24.00 g
Sodium citrate 26.50 g electrolytes
Sodium chloride 41.50 g
20 Sodium bicarbonate 68.00 g
Glucose 350.00 g

Terra rubrum 2.50 g dyestuff

25 Wheat bran 68.00 g roughage

Ispaghola husk
(dried seed coats of
plantago ovata) 400.00 g absorbent fibre

30 Lactase 0.25 g enzyme

Total 1000.00 g

- 1 The individual ingredients, all of which are available as dry powders, are mixed mechanically and are thereafter immediately ready for use.
- 5 The agent according to the invention must not be administered in dry form, but must be suspended in water and administered as a solution or suspension. The intumescence occurs hereafter in the intestinal canal during a suitable period, whereby by absorption
- 10 of fluid said intumescence swells up and gives the contents of the intestine a suitable consistency, and binds and receives some of the bacteria and their toxins so that a diarrhoea is at once stopped.

15 Example 2

The preparation according to the invention can also have the following composition which is particularly preferred for human application:

20

1000 g contains:

	Magnesium oxide	6.17 g
	Citric acid	14.50 g
25	Potassium chloride	25.75 g
	Sodium citrate	28.45 g
	Sodium chloride	44.56 g
	Sodium bicarbonate	73.00 g
	Glucose	375.80 g
30	Ispaghula husk, crushed	429.50 g
	Lactase	0.27 g
	Oil of peppermint	2.00 g

1 Example 3

A suspension or solution of the preparation prepared in example 1 is produced by mixing 50 g preparation 5 to 1 liter of water. The pH-value in the fresh preparation is 8.56. By filtration to a pH-value of 5.73 there is used 40.5 meq hydrochloric acid which shows that there is a not inconsiderable Buffer effect in the preparation which will "neutralise" the hydro- 10 chloric acid in the stomach and consequently protect the lactase. -

The chemicals used in the examples are ordinary commercial chemicals and the lactase is preferably 15 CHBS lactase 25.000 from Chr. Hansens Laboratorium, Copenhagen.

1

P A T E N T C L A I M S

1. Preparation for rehydrating monogastric animals, including human beings, suffering from diarrhoea, characterised in that it comprises an absorbent intumescent, electrolytes, lactose-decomposing enzyme(s) and perhaps roughage, taste corrigent(s) and/or dyestuff.
- 10 2. Preparation according to claim 1, characterised in that the electrolytes comprise such salts as will replace salts lost by diarrhoea.
- 15 3. Preparation according to claims 1 or 2, characterised in that the electrolytes are composed in such a manner that they give a buffer effect in the preparation in solution or suspension.
- 20 4. Preparation according to claim 1, 2 or 3, characterised in that the intumescent is selected among vegetable fibres from the family plantaginacea, seeds or vegetable matter from the family linum, pectin, hemicellulose, carboxymethyl cellulose, methyl cellulose, perhaps pregelatinised
- 25 starch and albumine tannate, the electrolytes are a mixture of two or more of the substances magnesium oxide, magnesium carbonate hydroxide, magnesium hydroxide, magnesium silicate, calcium silicate, calcium carbonate, alkali metal chlorides such as
- 30 sodium or potassium chloride, alkali metal hydrogen carbonates such as sodium or potassium hydrogen carbonate, aluminium phosphate, aluminium hydroxide, citric acid and alkali metal citrates such as sodium or potassium citrate, enzymes are a lactase with

- 1 pH-optimum between 2 and 10, the roughage is a fibre material such as bran, especially wheat bran, and the dyestuff is a pharmaceutically tolerable dyestuff.
- 5 5. Preparation according to claim 4, characterised in that the electrolytes are a mixture of magnesium oxide, sodium chloride, potassium chloride, sodium hydrogen carbonate, citric acid, sodium citrate and glucose, the enzyme is lactase
- 10 10 with a pH-optimum between 5 and 8, the roughage is wheat bran, and the dyestuff is terra rubrum.
- 15 6. Preparation according to any one of claims 1-5, characterised in that the intumescent is vegetable fibres from the family plantaginacea.
- 20 7. Preparation according to claim 6, characterised in that the fibres are in the form of dried, crushed seed coats of *Plantago ovata*.
- 25 8. Preparation according to any one of claims 1-7, characterised in that the intumescent constitutes 20-70 percentage by weight, the electrolytes constitute 40-60 percentage by weight, the enzyme or enzymes constitute 0.01-5 percentage by weight and the balance is made up of roughage and perhaps taste corrigent(s) and/or dyestuff(s).
- 30 9. Preparation according to claim 8, characterised in that as an intumescent it contains 40 percentage by weight *Isphagula Husk*, 52.925 percentage by weight electrolytes which are made up of 0.575 percentage by weight magnesium oxide, 1.35 percentage by weight citric acid, 2.4 percentage by

1 weight potassium chloride, 2.65 percentage by weight sodium citrate, 4.15 percentage by weight sodium chloride, 6.8 percentage by weight sodium hydrogen carbonate and 35 percentage by weight glucose calculated on the finished preparation, 0.025 percentage by weight lactase, 6.8 percentage by weight roughage in the form of wheat bran and 0.25 percentage by weight dyestuff in the form of terra rubrum.

5

10 10. Preparation according to any one of claims 1-7, characterised in that the intumescent constitutes 20-70 percentage by weight, electrolytes constitute 40-60 percentage by weight, the enzyme or enzymes constitute 0.01-5 percentage by weight and 15 the balance taste corrigents.

15

20 11. Preparation according to claim 10, characterised in that as an intumescent it contains approx. 43 percentage by weight Ispaghula Husk being ground, approx. 57 percentage by weight electrolytes which are made up of 0.617 percentage by weight magnesium oxide, 1.45 percentage by weight citric acid, 2.575 percentage by weight potassium chloride, 2.845 percentage by weight sodium citrate, 4.456 percentage by weight sodium chloride, 7.3 percentage by weight sodium bicarbonate, 37.58 percentage by weight glucose calculated on the finished preparation, 0.027 percentage by weight lactase and 0.2 percentage by weight taste corrigent in the form of oil of peppermint.

25

30 12. Use of a preparation according to any one of the claims 1-9 for treating diarrhoea among monogastric animals, including human beings, or new-born ruminants by which a dose, preferably 40-55 g, is mixed in a

- 1 portion of lukewarm water or milk or a water/milk mixture, preferably 1 litre and at about a temperature of 38°C, and administered orally.

This International search report has not been established in respect of certain claims under Article 17(2) (a) for the following reasons:
 1. Claim numbers 12, because ^{it} _{they} relate to subject matter ¹¹ not required to be searched by this Authority, namely:

A method for treatment of the human or animal body by therapy
 (PCT Rule 39 (iv)).

2. Claim numbers, because they relate to parts of the International application that do not comply with the prescribed requirements to such an extent that no meaningful International search can be carried out ¹², specifically:

VI. OBSERVATIONS WHERE UNITY OF INVENTION IS LACKING ¹¹

This International Searching Authority found multiple inventions in this International application as follows:

1. As all required additional search fees were timely paid by the applicant, this International search report covers all searchable claims of the International application.
2. As only some of the required additional search fees were timely paid by the applicant, this International search report covers only those claims of the International application for which fees were paid, specifically claims:
3. No required additional search fees were timely paid by the applicant. Consequently, this International search report is restricted to the invention first mentioned in the claims; it is covered by claim numbers:
4. As all searchable claims could be searched without effort justifying an additional fee, the International Searching Authority did not invite payment of any additional fee.

Remark on Protest

- The additional search fees were accompanied by applicant's protest.
- No protest accompanied the payment of additional search fees.
